Automated Histamine System

RAPID • EFFICIENT • VERSATILE • COST EFFECTIVE

Handles many biological fluids including whole blood and washed leukocytes. Samples containing protein may be introduced directly into the system using dialysis.

The automated system provided by ALPKEM can be used in a variety of research and quality control applications: Histamine release studies in allergic patients; influence of human antibodies on the outcome of allergic patients; histamine release or allergic response in humans from pharmaceuticals; or wherever histamine release-allergic responses are of interest.

The automated histamine release for allergy testing corresponds very favorably with the scratch and intradermal methods currently in use. The system provides an excellent tool for standardizing allergens utilized in allergy testing.

ADVANTAGES

■ SPEED:
Process 30 samples per hour or more than 200 samples per 8 hour day.

■ ACCURATE-EFFICIENT:
Precision is enhanced by automation: ±2% versus ±5% accuracy when performed manually. Automation simplifies the assay and minimizes the incidence of error.

■ SENSITIVE:
The ALPKEM automated system operates over a wide range of histamine concentrations. The detector can be adjusted for 0.5 — 10 ng/ml or 0.5 — 500 ng/ml.

■ SMALL SAMPLES:
When analyzing washed leukocytes, a small sample is required — approximately one-third of the sample size for the manual method.

■ SIMPLICITY:
The ability of the system to handle whole blood samples using dialysis, simplifies the preparation of leukocytes for histamine release studies.

■ COMPARABLE RESULTS:
The automated system provided by ALPKEM is currently used by leading researchers performing histamine studies. Published results permit a direct comparison.

Another innovation in continuous flow from:

Notice to Contributors
(Effective July 1976)

Scope of Submitted Manuscripts
The Journal invites for review original papers dealing with any aspect of interactions of chemicals with biological systems. Both terms—"chemicals" and "biological systems"—imply as general application as possible. Manuscripts dealing primarily with new methods will be reviewed only if the methods are shown to lead to new or more reliable data than were previously attained.

Organization of the Manuscript.
In most cases manuscripts should contain the following sections in the order listed: 1) title page; 2) running title page; 3) abstract; 4) introduction; 5) methods; 6) results; 7) discussion; 8) acknowledgments; 9) references; 10) footnotes; 11) tables; 12) legends for figures; and 13) figures. Each section should begin on a new page.

Submission of Manuscripts.
Two typewritten copies, double-spaced on 21.6- by 28-cm paper, should be sent to Dr. Eva King Killam, Department of Pharmacology, School of Medicine, University of California, Davis, California 95616. Pages should not be stapled together.

It is understood that neither the manuscript nor the data it contains have been previously published nor are being submitted elsewhere for publication.

If and when the manuscript is accepted for publication, it will be necessary for the American Society for Pharmacology and Experimental Therapeutics, Inc., to receive in writing assignment of copyright from all authors of each manuscript. The forms for this assignment will be mailed from the Editorial Office.

1. Title page. This should contain the complete title of the manuscript, the names of all authors, and the laboratory of origin.

2. Running title page. Each published paper needs a running title, which appears at the top of each page in the Journal. The running title should contain no more than 35 spaces, including punctuation. It should convey the sense of the full title. Commonly used abbreviations (such as "ATP," "ACh," etc.) may be used in the running title. This page should also contain the name and address of the person to whom galley proof should be sent.

3. Abstract. Each published paper should be preceded by an abstract. The abstract should begin with the names of the authors and the title of the manuscript. It should present in a concise form the purpose, the general methods, the findings, and the conclusions of the manuscript. Abstracts should be limited to 200 words or less; abstracts of more than 250 words will not be accepted.

4. Introduction. This section should not be labeled. It should contain a clear statement of the aims of the reported work, or of the hypotheses which the work was designed to test. A brief account of the background of the reported work may also be given in this section.

5. Methods. This section should contain explicit, concise descriptions of all new methods or procedures employed in the work. Modifications of previously published methods should be described. Commonly used methods require only a citation of the original source. When methods are described, the description should be such as to enable the reader to judge their accuracy, reproducibility, reliability, etc. Very extended descriptions of methods may be submitted for deposit with the American Society for Information Science National Auxiliary Publications Service (NAPS) c/o Microfiche Publications, P.O. Box 3513, Grand Central Station, New York, NY 10017. A text reference or footnote stating that the full description is available from NAPS permits interested readers to obtain the information, and does not occupy an inordinate amount of Journal space. There is a nominal charge to authors for this procedure; those who request the complete information from NAPS pay a small fee.

6. Results. This section ordinarily contains the experimental data to be presented, but not extended discussions of their significance. Results are usually easier for readers to grasp if they are presented in graphic or tabular form, rather than descriptively. Graphic presentation of data is preferred over tabular presentation. Data should not be needlessly repeated in text, tables, and figures. Sufficient data must be given to allow readers to judge the variability and reliability of the results. Statistical tests used and the data analyzed should be explained so that the interested but non-expert reader can interpret the findings.

7. Discussion. This section should be pertinent to the results. Speculative discussion is not discouraged, but the speculation should be based on the data presented. The discussion should be as concise as possible, within the limits of the ideas which the authors wish to propose.

8. Acknowledgments. These may be included at the end of the body of the text of the manuscript, but should have a separate heading.

9. List of references. In text citations, give the author's name and the year of publication (e.g., McCarthy, 1952; Ruth and Gehrig, 1929). With more than two authors, the text citation should contain the name of the first author, followed by "et al.," and the date (e.g., Kennedy et al., 1960). In the list of references, entries are to be arranged alphabetically by author, and not numbered. All authors' names are to be given. If reference is made to more than one publication by the same authors in the same year, suffixes (a, b, c, etc.) should be added to the year in the text citation and in the list of references.

The list of references is to contain, in sequence, the following information: authors' names and initials, title of the cited article, title of the journal in which the article appeared (abbreviated; see below), volume number of the journal, inclusive pagination, and year of publication. Abbreviations for journals should conform to the Biographical List of Serials (Biological Abstracts Information Service of Biological Abstracts, Philadelphia, Pa. 19103). Citations of personal communications or of unpublished observations should be given in parentheses at the appropriate place in the text, not in the list of references. A paper may not be cited as "in press" unless it has been accepted for publication. In such cases, give the name of the journal.

Except in extraordinary circumstances, no more than four references should be cited in support of any given point.

10. Footnotes. All footnotes to the title, authors' names, or text should be indicated by arabic numeral
11. Tables. Each table should be on a separate page. Tables should be numbered consecutively with arabic numerals, and should be designed to fit the column or page size of the Journal. A brief descriptive title should be given at the top of each table. The table number should be given in capital letters, the title in boldface upper and lower case letters (e.g., TABLE 3. Uptake of labeled drug by rat liver slices). The footnotes to the tables should be referred to by italicized lower case superscript letters (a, b, c, etc.) and should appear beneath the table involved, not on a separate page of the manuscript. Extensive tabular material not absolutely essential to the manuscript will be accepted for deposit with the ASIS/NAPS (see “Methods,” above). In such instances a footnote in the published paper will refer the interested readers to NAPS from which copies may be obtained.

12. Legends for figures. These should be numbered consecutively in arabic numerals, and should appear on a separate page of the manuscript. Legends should explain the figures in sufficient detail so that repeated referral to the text is unnecessary. Abbreviations in the legends should conform to those in the text (see “Abbreviations,” below).

13. Figures. Illustrations should be submitted in duplicate as unmounted glossy photographic prints, no larger than 8 by 10 inches. The authors’ name and address, and the number of the figure should be placed on the back of each print. Illustrations must be clear enough to permit reproduction without retouching, and legibility after reduction to single-column size (approximately 3½ inches in width). Uniform symbolism should be used for all illustrations in a manuscript. Symbols, numbers, and letters in the illustrations must be at least 1.5 mm in height after reduction to single column size. The title of each figure should appear in the legend rather than on the figure itself. Photomicrographs and electron micrographs should be labeled with a magnification calibration in micro or Angstrom units. A statement of the magnification should appear in the figure legend.

Abbreviations.
Magnitudes of variables being reported should be expressed in numerals. Most abbreviations are used without punctuation, with no distinction between singular and plural forms (e.g., 1 mg, 25 mg). The usual prefixes are to be used for multiples or submultiples of the basic units (e.g., kg, g, mg, µg, ng, pg). The following abbreviations, or their properly prefixed multiples or submultiples, may be used without definition in the text, tables, and figures:

### Units of mass
- gram (g)
- mole (mol)
- equivalent (Eq)
- microgram (µg)

### Units of concentration
- molar (moles/liter) (M)
- normal (Eq/liter) (N)
- percent (%)

### Units of electricity
- volt (V)
- ampere (A)
- cycles/sec (Hz)

### Units of radioactivity
- curie (Ci)
- counts per min (cpm)
- disintegrations per min (dpm)
- roentgen (r)

### Units of length or volume
- meter (m)
- micron (µ)
- Angstrom (Å)
- liter (l (spell out in text))

### Units of time
- hour (hr)
- minute (min)
- second (sec)

### Miscellaneous
- degrees of temperature (°C)
- gravity (g)
- median doses (LD₅₀, ED₅₀, etc.)
- optically isometric forms (d, l, dl–)
- routes of drug administration (i.v., i.p., s.c., i.m.)
- standard deviation (S.D.)
- standard error (S.E.)

Whenever an abbreviation other than those above is to be used in a manuscript, it is to be defined in the text or in a footnote thereto, the first time it is used. Abbreviations for commonly used substances should be those recommended by the Journal of Biological Chemistry. Abbreviations for drugs may be used if properly defined on first use, and if the chemical or generic name of the drug is given when the abbreviation is first used. Abbreviations may be used in the running title, but not in the full title of manuscript.

Drugs.
Generic names should be used in text, tables, and figures. Trade names may be mentioned in parentheses in the first text reference to the drug, but should not appear in titles, figures or tables. When a trade name is used, it should be capitalized; generic or chemical names are not capitalized. The chemical nature of new drugs must be given when it is known. The form of drug used in calculations of doses (e.g., base or salt) should be indicated. When several drugs are used, it may save space to include a separate paragraph in “Methods,” or a separate table or footnote, listing the relevant information about all drugs employed.

Page Charges.
Authors are assessed page charges at the rate of $30 per printed page. With the galley proof, authors will receive a request for information concerning such charges. These charges will be assessed only if they involve no personal expense to the authors.

The cost of a limited number of illustrations will be borne by the Journal: the cost of excessive numbers of illustrations will have to be defrayed by the authors.

Copies of this Notice may be obtained free of charge from the Editor.
What are the implications of recent advances in cellular and molecular biology for pharmacologists and toxicologists?

**WORKSHOP ON CELLULAR AND MOLECULAR TOXICOLOGY**
Edited by Don Fawcett & James Newberne

That's the subject addressed in this new book, the product of a symposium organized by the Pharmaceutical Manufacturer's Association Foundation. The Workshop brings together leading authorities from cell biology, pharmacology, pathology, and toxicology to consider the implications of recent advances in cellular and molecular biology for you and your colleagues.

The Workshop covers the following topics:

- Current concepts of molecular organization of the cell membrane... plus surface specialization related to cell-to-cell communication
- Nature of surface receptors and their interaction with hormones... plus experimental studies on the induction of acetylcholine receptors on muscle
- Membrane systems of the cytoplasm, including their role in detoxification & metabolism of drugs... along with changes in these functions with advancing age
- Important section on the nucleus... includes recent progress in defining the structure of chromatin, mechanisms of DNA damage and repair, nature of interaction between steroid hormones and the nucleus
- Discussion of relative advantages of microbial methods and sister chromatid exchange in mammalian cells for the assessment and mutagenicity of drugs and environmental toxins... plus methods of protection against the mutagenic effect of certain drugs
- Section on lysosomes and their destabilization by drugs... plus approaches to the treatment of lysosomal disease

Now the results of this unique study are available to you in a hardbound overprint from Pharmacological Reviews. If you want the latest information on advances in toxicology, this is one meeting you can't afford to miss.

---

**Handy manual highlights most frequently used drugs**

**MANUAL OF CLINICAL PHARMACOLOGY**
Edited by David H. Robertson, MD, Assistant Professor of Medicine and Pharmacology. Vanderbilt University School of Medicine, and Craig R. Smith, MD, Acting Director. Division of Internal Medicine. The Johns Hopkins University School of Medicine

A handy new manual supplements the large, more unwieldy references that are probably already part of your library. It gives you the most thorough understanding possible of the several dozen key drugs that are most commonly used in clinical practice. An annotated bibliography on these drugs is supplied as a point of access to the more detailed pharmacological literature. The discussion sections aren't intended to be complete reviews... but they identify for you quickly which drugs are practical... or difficult... or new.

This manual will supplement your knowledge of the many thousands of drugs on the market by giving you a very thorough understanding of the few dozen drugs that are most frequently used, highlighting those areas that are most important to you.

1981/about 250 pages/about $18.00 [U.S.] (*7300-1)
