CONTENTS

NUMBER 1, SEPTEMBER, 1928

I. The Relation Between Concentration and Action of Adrenaline. By David Wilkie........................................................................ 1

II. A Comparative Study of the Prophylactic and Sterilizing Properties of Certain Organic Arsenical and Mercurial Compounds in Experimental Rabbit Syphilis. By G. E. Wakerlin and A. S. Loevenhart.............. 15

III. The Therapeutic Action of Certain Organic Mercurial Compounds in Experimental Rabbit Syphilis. By G. E. Wakerlin and A. S. Loevenhart. 23

IV. The Electromotive Action of Drugs as a Cause of Their Toxicity. IV. The Augmentor Effect. By R. Beutner ........................................... 29

V. The Reversal by Ergotamine of the Effect of Ephedrine on the Blood Pressure. By F. R. Curtis......................................................... 37

VI. The Emetic Action of Digitalis Bodies and Strophanthidin in Cats with Denervated Hearts. By Melvin Dresbach and Kenneth C. Waddell. 43

VIII. Comparative Studies on Pupillary Reaction in Tetrapods. IV. The Mode of Action of Pilocarpine on the Pupil of the Rat. By Theodore Koppányi................................................................. 73

X. The Site of the Toxic Action of Nicotin on the Respiratory Mechanism. By J. Earl Thomas and F. E. Franke ........................................ 111

XI. Concerning the Absorption of Quinin and Oxyquinolin Sulphate Through the Vagina. By David I. Macht........................................ 137

XII. The Role of the Liver in Controlling the Distribution of Blood. By Alvah R. McLaughlin................................................................. 147

XIII. On the Prevention of Experimental Effusions by Calcium Salts. By Harry Gold................................................................. 169

XIV. Studies on Toxicity of Sodium Fluosilicate. By S. Marcovitch................................................................. 179

XVII. IV. A Note on the Rhythmic Contractions of the Ureter as Influenced by Pituitary Extract and by Histamine. By Charles M. Gruber............ 203

NUMBER 2, OCTOBER, 1928

X. The Site of the Toxic Action of Nicotin on the Respiratory Mechanism. By J. Earl Thomas and F. E. Franke ........................................ 111

XI. Concerning the Absorption of Quinin and Oxyquinolin Sulphate Through the Vagina. By David I. Macht........................................ 137

XII. The Role of the Liver in Controlling the Distribution of Blood. By Alvah R. McLaughlin................................................................. 147

XIII. On the Prevention of Experimental Effusions by Calcium Salts. By Harry Gold................................................................. 169

XIV. Studies on Toxicity of Sodium Fluosilicate. By S. Marcovitch................................................................. 179

XVII. IV. A Note on the Rhythmic Contractions of the Ureter as Influenced by Pituitary Extract and by Histamine. By Charles M. Gruber............ 203

ILLUSTRATIONS

Action of adrenaline on isometric response of carotid strip (Fig. 1)........ 2
— of adrenaline on isometric responses of several carotid strips (Fig. 2).... 3
— of adrenaline on isotonic contraction of carotid strips (Fig. 3).......... 5
Effect of perfusion with adrenaline on outflow and radius of frog's aorta
(Fig. 4). ........................................................................ 7
Action of adrenaline injections on blood pressure of cat (weight 2 kgm.)
(Fig. 5). ........................................................................ 9
Healing power of mercuric salicylate in experimental rabbit syphilis (Fig. 1)..... 25
— power of flumerin in experimental rabbit syphilis (Fig. 2)............. 26
— power of the sodium salt of 1-mercuri-bis-3-nitro-naphthalene-8-carbon
ylic acid (drug 93) in experimental rabbit syphilis (Fig. 3)............. 27
Electromotive action of drugs as a cause of their toxicity (Fig. 1)....... 31
Reversal by ergotamine of the effect of ephedrine on the blood pressure (Figs.
1 and 2) ........................................................................ 38
— by ergotamine of the effect of ephedrine on the blood pressure (Figs.
3 and 4) ........................................................................ 39
Studies on the toxicity of various lead compounds given intravenously
(Figs 1 to 6) .................................................................... 102
Curve showing the average rate of decrease in the response to the respiratory
impulses of the intact diaphragmatic muscle, in six dogs, due to the
peripheral action of Nicotin. (Dose, 15 mgm. per kilogram) (Fig. 1) .... 119
Records showing the effect of experimental procedures on the contractions
which persisted in the excised diaphragmatic muscle after peripheral paral-
ysis due to nicotin had occurred elsewhere in the animal (Fig. 2) ....... 125
Simultaneous records of the contractions of the intact right side and ex-
cised left side of the diaphragm, and the blood pressure, in a dog (11 kgm.)
that received 15 mgm. of nicotin per kilogram intravenously (Fig. 3) ... 126
Experiment. February 21, 1928. Dog. Peraldehyde anesthesia (Fig. 1) .... 139
—. February 23, 1928. Dog. Peraldehyde anesthesia (Fig. 2) ........... 140
—. February 23, 1928. Dog. Peraldehyde anesthesia (Fig. 3) ........... 141
Reaction of the liver of a dog to 1.2 cc. epinephrine per liter. July 29, 1924
(Fig. 1) ........................................................................ 163
Action of epinephrine (1:500,000) upon the liver of a rabbit. May 24, 1924
(Fig. 2) ........................................................................ 163
— of barium chloride, 0.4 per cent upon the liver of a cat. May 17, 1924
(Fig. 3) ........................................................................ 164
— of barium chloride, 0.4 per cent upon the liver of a rabbit. May 23, 1924
(Fig. 4) ........................................................................ 164
Velocity of fatality culex quinquesfasciatus (Fig. 1) ......................... 180
Hyperglycemic action of epinephrine and of ergotamine (Fig. 1) ........ 199
Combined hyperglycemic action of epinephrine and ergotamine (Fig. 2) ... 200
ILLUSTRATIONS

Bladder half of excised pig ureter previously kept in C. Locke's solution twenty hours (Fig. 1) ................................................ 204
Same as figure 1 except that the entire ureter was employed (Fig. 2) .......... 205
Partial vasomotor reversal to epinephrine effected by ergotamine, later rendered complete after shock had been induced by means of histamine (Fig. 1) .............................................................. 243
Augmented susceptibility to ergotamine in histamine shock (Fig. 2) .......... 246
Progressively increasing vasomotor inhibition in shock and complete vasomotor reversal after 0.1 mgm. ergotamine tartrate per kilogram (Fig. 3) .............................................................. 251
Partial vasomotor reversal produced by severe hemorrhage and augmented susceptibility to ergotamine in hemorrhage shock (Fig. 4) ........ 252
— vasomotor reversal obtained subsequent to the injection of 1.0 mgm. per kilogram of ergotamine tartrate made nearly complete by severe hemorrhage, and partial restoration of the peripheral vasomotor mechanism by reinjecting of the withdrawn blood (Fig. 5) .............................................................. 253
Serum calcium after intraperitoneal inoculation with 0.001 mgm. bovine tubercle bacilli (Fig. 1) ................................................ 209
— calcium after intraperitoneal inoculation with 0.001 mgm. bovine tubercle bacilli (Fig. 2) ................................................ 270
— calcium, weight, and rectal temperature after intraperitoneal inoculation of 0.001 mgm. bovine tubercle bacilli (Fig. 3) ...................... 271
Sketch of the main veins of the fowl's kidney, with the position of the various clamps indicated (Fig. 1) ................................................ 279
Renal blood-flow of the bird (Figs. 2, 3 and 4) ................................................ 283
— blood-flow of the bird (Figs. 5, 6 and 7) ................................................ 284
— blood-flow of the bird (Figs. 8, 9 and 10) ............................................. 285
Schema of apparatus and connections (Fig. 1) ................................................ 294
Photograph of special Condon recorder (Fig. 2) ............................................. 295
— of electric valve, with manometer attached (Fig. 3) ............................................. 296
Chart showing that methyl and ethyl alcohols and glycerol increase sugar utilization; that the anesthetics chloroform, ether and ethylene decrease it while nitrous oxide has practically no effect (Fig. 1) ...................... 300
Renal excretion of chlorides and water (Fig. 1) ............................................. 309
— excretion of chlorides and water (Fig. 2) ............................................. 311
Serum calcium in rabbit 23 following subcutaneous inoculation of 0.001 mgm. bovine tubercle bacilli: ulceration of the local lesion. Rabbit 28 a normal control (Fig. 1) ................................................ 319
— calcium in rabbit 85 following subcutaneous inoculation of 0.001 mgm. bovine tubercle bacilli: no ulceration of the local lesion (Fig. 2) .......... 322
Thermal conductivity methods of gas analysis in the study of pharmacological problems (Fig. 1) ................................................ 326
Apparatus as used except for the galvanometer which was changed for 2500-e Leeds-Northrup type (Fig. 2) ................................................ 327
Drum calibration curves for CCl₄ and C₂Cl₄ (Fig. 3) ................................................ 329
Concentration curves in milligrams per liter of CCl₄ in the exhaled air of three dogs after injection of this substance into the small intestine (Fig. 4) .......... 330
Showing various monochromatic bands studied (Fig. 1) ............................................. 371
Guinea-pig blood corpuscles showing development of crenation. Injection of average lethal doses of NaClO₃. Chronic poisoning (Fig. 1)............. 399
CIBN33. Relation of the average chlorid concentration of the blood to different levels of systolic blood pressure (Fig. 1)......................... 410
CIBN34. Relation of the average chlorid concentration in the blood to different, rising, levels of diastolic blood pressure (Fig. 2)............. 410
CIBN35. Relation of the average systolic blood pressure to varying blood chlorid concentrations (Fig. 3)...................................................... 411
CIBN36. Relation of the average diastolic blood pressure to varying blood chlorid concentrations (Fig. 4)...................................................... 411
CIBN6. Graphic illustration of progress in a patient under treatment for hypertension with bismuth subnitrate (Fig. 5)............................... 412
CIBN22. Graphic illustration of progress in a patient under treatment for hypertension with bismuth subnitrate, showing a definite rise in the chlorid content of the blood as the blood pressure falls (Fig. 6)........... 413
CIBN21. Graph illustrating spontaneous variation of the blood chlorides and blood pressure in a normal subject (Dr. O. D. J.)......................... 414
CIBN20. Graph showing spontaneous variations in the blood chlorides and blood pressure of the author (Fig. 8)............................................ 415
CIBN26. Graph showing fluctuation of blood pressure with associated changes in the blood chlorides (Fig. 9)............................................. 416
